Existing Fleet Portfolio Summary by Scenario

Component	Description
Portfolio Generation Cost	The total variable costs associated with operating the portfolio, including fuel, emissions, VOM, contract (PPA) costs, and net market purchases from the MISO energy market
Resource Cost	The sum of all variable costs associated with owned generating assets, including fuel, emissions, and VOM
Contract Purchases Cost	The sum of all contract or PPA costs plus costs associated with new DSM programs
Market Sales Cost	Costs associated with energy market sales to MISO
Market Purchases Cost	Costs associated with energy market purchases from MISO

Portfolio Name:	Retirement 1
Scenario	Reference

Note: Negative portfolio generation costs in the EWD scenario result from how NIPSCO accounts for the Clean Energy Standard for modeling purposes. In Aurora, every "clean" MWh is assumed to receive a credit for a sale at the REC or "CEC" price. NIPSCO then "buys back" its load requirement through the "Gross REC Purchase Cost" line item in the Rev Req Components tabs, resulting in a net customer cost benefit only accruing for clean energy *above* the standard.

Existing Fleet Portfolio Summary by Scenario

Component	Description
Portfolio Generation Cost	The total variable costs associated with operating the portfolio, including fuel, emissions, VOM, contract (PPA) costs, and net market purchases from the MISO energy market
Resource Cost	The sum of all variable costs associated with owned generating assets, including fuel, emissions, and VOM
Contract Purchases Cost	The sum of all contract or PPA costs plus costs associated with new DSM programs
Market Sales Cost	Costs associated with energy market sales to MISO
Market Purchases Cost	Costs associated with energy market purchases from MISO

Note: Negative portfolio generation costs in the EWD scenario result from how NIPSCO accounts for the Clean Energy Standard for modeling purposes. In Aurora, every "clean" MWh is assumed to receive a credit for a sale at the REC or "CEC" price. NIPSCO then "buys back" its load requirement through the "Gross REC Purchase Cost" line item in the Rev Req Components tabs, resulting in a net customer cost benefit only accruing for clean energy *above* the standard.

Existing Fleet Portfolio Summary by Scenario

Component	Description
Portfolio Generation Cost	The total variable costs associated with operating the portfolio, including fuel, emissions, VOM, contract (PPA) costs, and net market purchases from the MISO energy market
Resource Cost	The sum of all variable costs associated with owned generating assets, including fuel, emissions, and VOM
Contract Purchases Cost	The sum of all contract or PPA costs plus costs associated with new DSM programs
Market Sales Cost	Costs associated with energy market sales to MISO
Market Purchases Cost	Costs associated with energy market purchases from MISO

Note: Negative portfolio generation costs in the EWD scenario result from how NIPSCO accounts for the Clean Energy Standard for modeling purposes. In Aurora, every "clean" MWh is assumed to receive a credit for a sale at the REC or "CEC" price. NIPSCO then "buys back" its load requirement through the "Gross REC Purchase Cost" line item in the Rev Req Components tabs, resulting in a net customer cost benefit only accruing for clean energy *above* the standard.

Existing Fleet Portfolio Summary by Scenario

Component	Description
Portfolio Generation Cost	The total variable costs associated with operating the portfolio, including fuel, emissions, VOM, contract (PPA) costs, and net market purchases from the MISO energy market
Resource Cost	The sum of all variable costs associated with owned generating assets, including fuel, emissions, and VOM
Contract Purchases Cost	The sum of all contract or PPA costs plus costs associated with new DSM programs
Market Sales Cost	Costs associated with energy market sales to MISO
Market Purchases Cost	Costs associated with energy market purchases from MISO

Note: Negative portfolio generation costs in the EWD scenario result from how NIPSCO accounts for the Clean Energy Standard for modeling purposes. In Aurora, every "clean" MWh is assumed to receive a credit for a sale at the REC or "CEC" price. NIPSCO then "buys back" its load requirement through the "Gross REC Purchase Cost" line item in the Rev Req Components tabs, resulting in a net customer cost benefit only accruing for clean energy *above* the standard.

Existing Fleet Portfolio Summary by Scenario

Component	Description
Portfolio Generation Cost	The total variable costs associated with operating the portfolio, including fuel, emissions, VOM, contract (PPA) costs, and net market purchases from the MISO energy market
Resource Cost	The sum of all variable costs associated with owned generating assets, including fuel, emissions, and VOM
Contract Purchases Cost	The sum of all contract or PPA costs plus costs associated with new DSM programs
Market Sales Cost	Costs associated with energy market sales to MISO
Market Purchases Cost	Costs associated with energy market purchases from MISO

Note: Negative portfolio generation costs in the EWD scenario result from how NIPSCO accounts for the Clean Energy Standard for modeling purposes. In Aurora, every "clean" MWh is assumed to receive a credit for a sale at the REC or "CEC" price. NIPSCO then "buys back" its load requirement through the "Gross REC Purchase Cost" line item in the Rev Req Components tabs, resulting in a net customer cost benefit only accruing for clean energy *above* the standard.

Existing Fleet Portfolio Summary by Scenario

Component	Description
Portfolio Generation Cost	The total variable costs associated with operating the portfolio, including fuel, emissions, VOM, contract (PPA) costs, and net market purchases from the MISO energy market
Resource Cost	The sum of all variable costs associated with owned generating assets, including fuel, emissions, and VOM
Contract Purchases Cost	The sum of all contract or PPA costs plus costs associated with new DSM programs
Market Sales Cost	Costs associated with energy market sales to MISO
Market Purchases Cost	Costs associated with energy market purchases from MISO

Note: Negative portfolio generation costs in the EWD scenario result from how NIPSCO accounts for the Clean Energy Standard for modeling purposes. In Aurora, every "clean" MWh is assumed to receive a credit for a sale at the REC or "CEC" price. NIPSCO then "buys back" its load requirement through the "Gross REC Purchase Cost" line item in the Rev Req Components tabs, resulting in a net customer cost benefit only accruing for clean energy *above* the standard.

Existing Fleet Portfolio Summary by Scenario

Component	Description
Portfolio Generation Cost	The total variable costs associated with operating the portfolio, including fuel, emissions, VOM, contract (PPA) costs, and net market purchases from the MISO energy market
Resource Cost	The sum of all variable costs associated with owned generating assets, including fuel, emissions, and VOM
Contract Purchases Cost	The sum of all contract or PPA costs plus costs associated with new DSM programs
Market Sales Cost	Costs associated with energy market sales to MISO
Market Purchases Cost	Costs associated with energy market purchases from MISO

Portfolio Summary

Component	Description
Portfolio Generation Cost	The total variable costs associated with operating the portfolio, including fuel, emissions, VOM, contract (PPA) costs, and net market purchases from the MISO energy market
Resource Cost	The sum of all variable costs associated with owned generating assets, including fuel, emissions, and VOM
Contract Purchases Cost	The sum of all contract or PPA costs plus costs associated with new DSM programs
Market Sales Cost	Costs associated with energy market sales to MISO
Market Purchases Cost	Costs associated with energy market purchases from MISO

Note: Negative portfolio generation costs in the EWD scenario result from how NIPSCO accounts for the Clean Energy Standard for modeling purposes. In Aurora, every "clean" MWh is assumed to receive a credit for a sale at the REC or "CEC" price. NIPSCO then "buys back" its load requirement through the "Gross REC Purchase Cost" line item in the Rev Req Components tabs, resulting in a net customer cost benefit only accruing for clean energy *above* the standard.

Portfolio Summary

Component	Description
Portfolio Generation Cost	The total variable costs associated with operating the portfolio, including fuel, emissions, VOM, contract (PPA) costs, and net market purchases from the MISO energy market
Resource Cost	The sum of all variable costs associated with owned generating assets, including fuel, emissions, and VOM
Contract Purchases Cost	The sum of all contract or PPA costs plus costs associated with new DSM programs
Market Sales Cost	Costs associated with energy market sales to MISO
Market Purchases Cost	Costs associated with energy market purchases from MISO

Note: Negative portfolio generation costs in the EWD scenario result from how NIPSCO accounts for the Clean Energy Standard for modeling purposes. In Aurora, every "clean" MWh is assumed to receive a credit for a sale at the REC or "CEC" price. NIPSCO then "buys back" its load requirement through the "Gross REC Purchase Cost" line item in the Rev Req Components tabs, resulting in a net customer cost benefit only accruing for clean energy *above* the standard.

Portfolio Summary

Component	Description
Portfolio Generation Cost	The total variable costs associated with operating the portfolio, including fuel, emissions, VOM, contract (PPA) costs, and net market purchases from the MISO energy market
Resource Cost	The sum of all variable costs associated with owned generating assets, including fuel, emissions, and VOM
Contract Purchases Cost	The sum of all contract or PPA costs plus costs associated with new DSM programs
Market Sales Cost	Costs associated with energy market sales to MISO
Market Purchases Cost	Costs associated with energy market purchases from MISO

Note: Negative portfolio generation costs in the EWD scenario result from how NIPSCO accounts for the Clean Energy Standard for modeling purposes. In Aurora, every "clean" MWh is assumed to receive a credit for a sale at the REC or "CEC" price. NIPSCO then "buys back" its load requirement through the "Gross REC Purchase Cost" line item in the Rev Req Components tabs, resulting in a net customer cost benefit only accruing for clean energy *above* the standard.

Portfolio Summary

Component	Description
Portfolio Generation Cost	The total variable costs associated with operating the portfolio, including fuel, emissions, VOM, contract (PPA) costs, and net market purchases from the MISO energy market
Resource Cost	The sum of all variable costs associated with owned generating assets, including fuel, emissions, and VOM
Contract Purchases Cost	The sum of all contract or PPA costs plus costs associated with new DSM programs
Market Sales Cost	Costs associated with energy market sales to MISO
Market Purchases Cost	Costs associated with energy market purchases from MISO

Note: Negative portfolio generation costs in the EWD scenario result from how NIPSCO accounts for the Clean Energy Standard for modeling purposes. In Aurora, every "clean" MWh is assumed to receive a credit for a sale at the REC or "CEC" price. NIPSCO then "buys back" its load requirement through the "Gross REC Purchase Cost" line item in the Rev Req Components tabs, resulting in a net customer cost benefit only accruing for clean energy *above* the standard.

Portfolio Summary

Component	Description
Portfolio Generation Cost	The total variable costs associated with operating the portfolio, including fuel, emissions, VOM, contract (PPA) costs, and net market purchases from the MISO energy market
Resource Cost	The sum of all variable costs associated with owned generating assets, including fuel, emissions, and VOM
Contract Purchases Cost	The sum of all contract or PPA costs plus costs associated with new DSM programs
Market Sales Cost	Costs associated with energy market sales to MISO
Market Purchases Cost	Costs associated with energy market purchases from MISO

Note: Negative portfolio generation costs in the EWD scenario result from how NIPSCO accounts for the Clean Energy Standard for modeling purposes. In Aurora, every "clean" MWh is assumed to receive a credit for a sale at the REC or "CEC" price. NIPSCO then "buys back" its load requirement through the "Gross REC Purchase Cost" line item in the Rev Req Components tabs, resulting in a net customer cost benefit only accruing for clean energy *above* the standard.

Portfolio Summary

Component	Description
Portfolio Generation Cost	The total variable costs associated with operating the portfolio, including fuel, emissions, VOM, contract (PPA) costs, and net market purchases
Resource Cost	The sum of all variable costs associated with owned generating assets, including fuel, emissions, and VOM
Contract Purchases Cost	The sum of all contract or PPA costs plus costs associated with new DSM programs
Market Sales Cost	Costs associated with energy market sales to MISO
Market Purchases Cost	Costs associated with energy market purchases from MISO

Note: Negative portfolio generation costs in the EWD scenario result from how NIPSCO accounts for the Clean Energy Standard for modeling purposes. In Aurora, every "clean" MWh is assumed to receive a credit for a sale at the REC or "CEC" price. NIPSCO then "buys back" its load requirement through the "Gross REC Purchase Cost" line item in the Rev Req Components tabs, resulting in a net customer cost benefit only accruing for clean energy *above* the standard.

Portfolio Summary

Component	Description
Portfolio Generation Cost	The total variable costs associated with operating the portfolio, including fuel, emissions, VOM, contract (PPA) costs, and net market purchases from the MISO energy market
Resource Cost	The sum of all variable costs associated with owned generating assets, including fuel, emissions, and VOM
Contract Purchases Cost	The sum of all contract or PPA costs plus costs associated with new DSM programs
Market Sales Cost	Costs associated with energy market sales to MISO
Market Purchases Cost	Costs associated with energy market purchases from MISO

Note: Negative portfolio generation costs in the EWD scenario result from how NIPSCO accounts for the Clean Energy Standard for modeling purposes. In Aurora, every "clean" MWh is assumed to receive a credit for a sale at the REC or "CEC" price. NIPSCO then "buys back" its load requirement through the "Gross REC Purchase Cost" line item in the Rev Req Components tabs, resulting in a net customer cost benefit only accruing for clean energy *above* the standard.

Contract Summary

Note that for modeling purposes, congestion expectations are incorporated in contract prices for certain renewable contracts
